# Summer CubeSat Project Evaluation – Brennen Yingling

# Summer of 2026

**To Whom It May Concern:**

I served as the Site Coordinator for our summer CubeSat project at Saint Francis University and had the opportunity to work closely with Brennen Yingling throughout the program. During the summer, I utilized Brennen as our student Project Manager, a position that required him to balance his own technical responsibilities with helping coordinate the work of the other students on the project.

Brennen proved to be extremely dependable and quickly became someone I could rely upon. He coordinated tasks among the students and helped keep the project on schedule, particularly when team members encountered unexpected software or hardware problems. Most mornings, Brennen provided me with a progress update on the team's activities, including what had been accomplished, problems that had been encountered, and what still needed to be completed. This allowed me to give him direction when necessary while relying on him to manage many of the day-to-day activities of the student team.

One of Brennen's greatest strengths was his willingness to work through difficult and sometimes intermittent technical problems. CubeSat development involves the integration of hardware and software, and problems are not always easy to reproduce or diagnose. I could rely on Brennen's persistence and work ethic when these problems occurred. On a number of occasions, he continued working beyond the normal workday in an effort to identify and resolve issues so that the project could continue moving forward.

Brennen also demonstrated an outstanding ability to work with the rest of the team. He was always willing to help another student when needed rather than focusing solely on his own responsibilities. For example, he assisted Kevin with his portion of the project when hardware or software problems arose. His willingness to help others was an important part of keeping the overall project on schedule and demonstrated the type of leadership that I value in a Project Manager.

I also relied on Brennen to design and label the FlatSat layout used by the team. This required him to consider how the various CubeSat components would be organized for development, integration, and testing and to create a layout that other members of the team could readily understand and use. I trusted him with this responsibility because he had demonstrated both the technical understanding and attention to detail necessary to complete it successfully.

Overall, I was extremely pleased with Brennen's performance during the summer CubeSat project. He demonstrated leadership, technical problem-solving ability, dependability, initiative, and a genuine willingness to help the people around him succeed. Most importantly, I knew that when I gave Brennen a responsibility, I could depend upon him to follow through. He was a valuable member of our CubeSat team, and I would gladly work with him again.

**Sincerely,**

Dr. Joseph P. Karwoski
Site Coordinator
